Can you run an air conditioner on solar power?

Yes, you absolutely can run an air conditioner on solar power. Nevertheless, it's important to understand that you can't just plug your regular AC into a small solar panel system and expect it to work perfectly. Air conditioners, especially traditional ones, need a significant amount of power to start up and run.

How much power does a solar air conditioning system need?

Living in a state that ensures a power generation equal to 4 - 6 sun peak hours at maximum efficiency, you will require nearly a 2kW PV system. This system produces enough energy to power the A/C during the day and for storing power to run the A/C for the rest of the 8 hours. [What To Look For In A Solar-Air Conditioning Kit?](#)

How does a solar AC work?

In simple terms, solar ACs use solar panels to power the air conditioning system. Solar panels collect energy from the sun. They convert this energy into power. That power either goes directly to the air conditioner or to a battery where it's stored until the AC needs it.

How does solar power affect your air conditioner?

Your air conditioner draws from this solar power first, only pulling from the grid if it needs more. Any excess solar power you generate is exported to the grid, often for credit. The Bottom Line: You are directly using sun power to run your AC, which can dramatically lower your electricity bill, especially in the summer.
