What is solar-plus-storage?

For solar-plus-storage--the pairing of solar photovoltaic (PV) and energy storage technologies--NREL researchers study and quantify the unique economic and grid benefits reaped by distributed and utility-scale systems. Much of NREL's current energy storage research is informing solar-plus-storage analysis.

How does solar-plus-storage affect energy systems?

Solar-plus-storage shifts some of the solar system's output to evening and night hours and provides other grid benefits. NREL employs a variety of analysis approaches to understand the factors that influence solar-plus-storage deployment and how solar-plus-storage will affect energy systems.

How much does solar storage cost?

Ember estimates that if half of daytime solar generation is shifted to nighttime, the \$65/MWh storage cost adds about \$33/MWh to the cost of solar electricity. With the global average price of solar at \$43/MWh in 2024, adding storage would bring the total cost to about \$76/MWh, delivering power in a way that better matches real demand.

How has solar-plus-storage helped keep the lights on?

Adding 19 GW of solar and 6.2 GW of storage since 2019 helped keep the lights on - an 800% increase in solar and 5,500% increase in battery storage over that period. Solar-plus-storage is solving demand growth by providing reliable power when the grid needs it most - during peak hours.
