How do energy storage systems work?

Energy storage systems, like large-scale batteries, are charged by electricity drawn from the power grid during periods of low demand or extra capacity, provided they are not directly connected to their own dedicated energy source. That electricity is stored and held until it's needed, such as during peak usage times, grid disturbances, or outages.

How will a 100MW battery energy storage system work?

The facility will serve as a large-scale battery energy storage system capable of charging from, and discharging into, the New York power grid. When fully functional, the 100MW battery energy storage project will be able to discharge electricity to the grid particularly during peak demand.

Why do you need a battery energy storage system?

Battery energy storage systems also help to balance the electricity network, providing necessary backup during power outages from severe weather events or accidents. This can prevent the need for more expensive upgrades to the power system, which helps keep electricity costs down over time.

What is energy storage?

Energy storage involves converting energy from forms that are difficult to store to more conveniently or economically storable forms. Some technologies provide short-term energy storage, while others can endure for much longer. Bulk energy storage is currently dominated by hydroelectric dams, both conventional as well as pumped.
